

Topsec Managed Phishing Awareness Training

**Phishing emails account for
67% of all cyber espionage**

Our solution allows you to test your employees
security awareness while training them

www.topsec.com | support@topsec.com | sales@topsec.com

Topsec Managed Phishing Awareness Training is an online solution that allows you to execute Real-Time Phishing attacks on your employees to test their security awareness while training them. We create, send, and manage the Phishing service on your behalf. Following the completion of the tests, a report is generated depending on the performance of each employee.

Our easy approach for simulating phishing attacks, in conjunction with our security awareness training, will assist you in combating phishing threats. Assess the human element of security and identify which staff require training. Topsec Managed Phishing Awareness Training makes social engineering testing simple to replicate spear phishing, clone phishing, and other hacking strategies

Our Phishing Simulator includes compelling ready-to-use phishing templates created by security professionals. Phishing is used in about half of all social engineering attacks. This figure rises to more than 91% when dealing with targeted spear-phishing and other cyber- attacks. Our security awareness training courses are short and to the point, and they are included with our phishing simulator.

**Conduct authorized phishing attacks to assess
and re-assess your workers' susceptibility to
socially engineered hacking tactics**

Benefits

Target & Group Management

Simulated phishing attacks on your staff are a vital aspect of your overall security awareness campaign. Target our whole organisation or specific groups using the same or different templates at a given time.

Mobile Friendly for All Devices

Topsec Phishing Awareness Training may be utilized on any device, allowing administrative chores to be completed at the office or on the move. Our personalized landing pages are also device-friendly, allowing us to design the most convincing phishing trap.

Phishing Reporting

Topsec Cloud Solutions provides a variety of reports, as well as comparing results on numerous tests to determine who is vulnerable. You may export in PDF or CSV format, as well as use our API to access our report system. We also have quick reporting with email notifications and completion summary emails.

Advanced Human Detection (AHD)

Topsec Cloud Solutions uses to help determine if an action was triggered by a human or caused by a bot/crawler. If AHD can determine that the action was caused by a bot or crawler, then it is considered a false positive and will be filtered out (i.e., not counted) from test results.

Benefits

Phishing Template Editor & Library

The Phishing Simulator provides a large collection of templates meant to imitate real-world attacks while removing all the risks. If you're familiar with HTML, you may write your own code to create highly personalized content or email template styles and submit it. You can select or create the precise landing page that an employee will view if they take the bait. These landing pages may be linked directly to LMS training and reinforcement activities.

Repeat Testing & Continuing Education

According to Verizon, phishing emails account for 67% of all cyber espionage. Using our Topsec Phishing Simulator, you can prevent email-based social engineering attacks and boost your most underutilized security asset. Topsec Cloud Solutions strongly advises a mix of simulated phishing attacks and focused training to develop a workforce resistant to the enticements of hackers.
